

Contents of the plastic bag

- 2 x hose connectors.
- 1 x tap connector with 1/2" reducer.
- 1 x hose connector with aqua stop.
- 1x handle.
- 1 x handle cap.
- 1 x tap connector.
- 1 x plastic washer.

Not shown

- 1 x nozzle.
- 2 x wall brackets.
- 2 x screws
- 2 x plastic nuts.

The 3rd hose connector is already installed inside the hose reel

The Hose Reel

Push the hose pipe to one side, so you can identify which side the internal hose connector is attached to.

In this case the hose connector is on the left handside.

Once you have identified which side the internal connector is on, you will attach the handle to the opposite side.

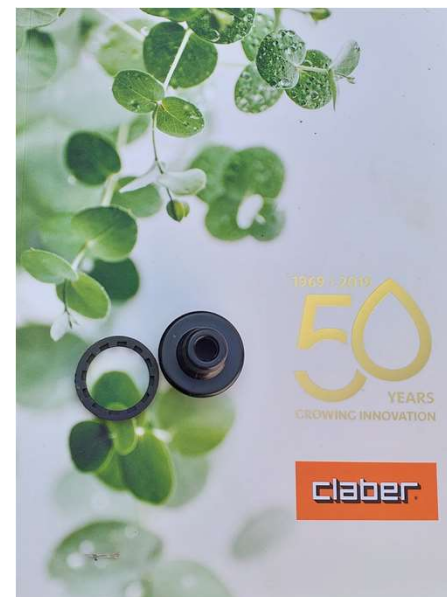

You will notice that the threaded part has “teeth” towards the back, take the handle and slot it into place.

Take the grey handle cap and screw this onto the thread to secure the handle in place.

Now find the plastic washer and tap connector.

Take the washer, you will notice that it also has “teeth” similarly to the handle.

Slot the washer into place.

And screw the tap connector into place.

If you don't already have a tap to hose reel extension, then you will have to cut a couple of metres of hose off the reel. Attach a hose connector to each end. Then screw the threaded tap connector to the tap. Most taps don't require the reducer, so please unscrew this.

We explain how to attach the hose connectors to the hose in a little more detail later.

Take the hose connector with the aqua stop valve.

Remove the end cap.

Slide the end cap over the hose.

Push the main body of the hose connector with aqua stop firmly onto the end of the hose.
If this is a little tight, use a tea spoon to open the "teeth" out a little to give more room to push the pipe onto.
And then screw the two parts together.
